Abstract

European integration represents one of the most significant political processes of contemporary history. This study examines, from historical, economic, legal, and geopolitical perspectives, the possible paths for the evolution of the European Union toward a functional federal structure. In an international context characterized by strategic competition among great powers, accelerated technological transformation, and increasing fragmentation of global value chains, continental scale emerges as a necessary condition for the preservation of effective sovereignty. This argument is grounded in institutionalist literature, comparative federal theory, and empirical observation of the current limitations of the European intergovernmental model.
